DIGESTIVE MEDICAL SERVICES INC.

Digestive Diseases Specialist

Caring and Compassionate
 Accepting New Patients

Dr Entsua completed his fellowship in Gastroenterology at Georgetown University in Washington DC and The National Institutes of Health in Bethesda Maryland.

Dr Entsua is board certified in Gastroenterology. His areas of interest are colon cancer prevention, peptic ulcer disease and wireless capsule endoscopy.

Dr Entsua is affiliated with Ohio health, Mount Carmel health, Fairfield Medical Center, OSU and Licking Memorial.

Professional memberships include American College of Gastroenterology (ACG), American Gastrointestinal Association (AGA) and American Society of Gastrointestinal Endoscopy (ASGE). He is well published in scientific journals.

Dr Entsua is married with children. In his spare time he enjoys playing with the family. He engages himself in health teaching programs for the youth and he speaks at relationship seminars for couples.

COLON CANCER

Colorectal cancer, often referred to as simply colon cancer, is the second leading cause of cancer death in the United States. Not counting skin cancers, colorectal cancer is the third most common cancer found in men and women in the U.S.

The risk of colorectal cancer increases with age; more than 90 percent of cases are diagnosed in persons aged 50 and over. Persons also at increased risk have personal or family history of colorectal cancer or polyps, and inflammatory bowel disease. Other possible risk factors include smoking, physical inactivity, high-fat and/or low-fiber diet, alcohol consumption, as well as low intake of fruits and vegetables.

Colon cancer is one of the most common forms of cancer in this country and surviving it could depend on your race. African-American men are 44 percent more likely to die from colon cancer than white men, and African-American women, 46 percent more likely to die than white women.

Half of all colon cancer deaths could be prevented with early detection. A colon cancer screening, or colonoscopy, allows doctors to remove polyps before they become deadly cancers.

- 2nd leading cancer death in the U.S.A.
- 55,000 Americans die yearly
- 85% colon cancer victims are symptom free
- Not all rectal bleedings are from hemorrhoids
- Colonoscopy for colon cancer screening starts at age 45 for African Americans
- Removing polyps prevents colon cancer
- Colonoscopy done every 5-10 years detects and remove the polyps which turn into cancer
- 5 year survival less than 5% for advanced colon cancer disease
- Call and schedule for your colonoscopy
- Special offers available for the uninsured
